OsiSense® XS
Inductive proximity sensors
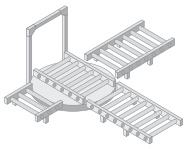
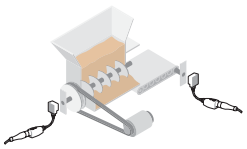
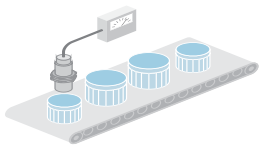
Applications



Conveying



Detection of underspeed, shaft overload



Position, displacement and deformation control/monitoring

2

Sensor type: flush and non-flush mountable

Adjustable range sensors

Sensors for rotation monitoring

Sensors with analog output 0–10 V or 4–20 mA

Developed in accordance with the needs expressed by our customers, these sensors provide a complete solution for specific application functions: rotation monitoring, selective detection, analog control, etc.

OsiSense® XS
Inductive proximity sensors

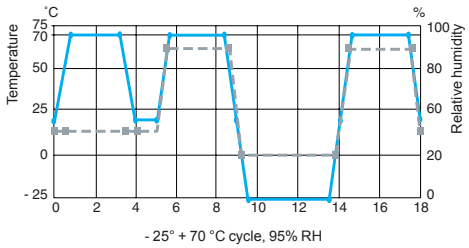
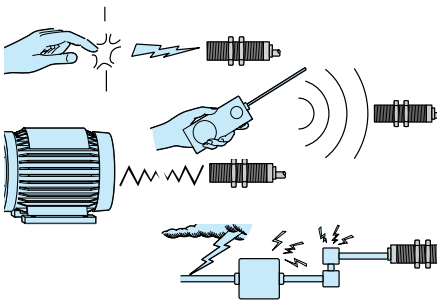
Standards and certifications
Parameters related to the environment



- 25° + 70 °C cycle, 95% RH

Temperature °C
Humidity as %



Insulation

Electrical insulation conforms to IEC standards 61140 and NF C 20-030 relating to means of protection against electric shock.

Recommendations

The sensors detailed in this catalog are designed for use in standard industrial applications relating to presence detection.
These sensors do not incorporate the required redundant electrical circuit enabling their usage in safety applications.
For safety applications, refer to the Preventa™ Machine Safety Products catalog

Quality control

A variety of precautions are taken in order to provide inductive proximity sensors suitable for harsh industrial environments.

- **Qualification**
  - The product specifications stated in this catalog are subject to a **qualification procedure** carried out in our laboratories.
  - In particular, the products are subjected to **climatic cycle** tests for 3,000 hours while powered up to verify their ability to maintain their specifications over time.
- **Production**
  - The electrical specifications and sensing distances at both ambient temperature and extreme temperatures are 100% checked.
  - Products are randomly selected during the course of production and subjected to **monitoring tests** relating to all their qualified specifications.
- **Customer returns**

Products that are returned to us and claimed inoperative are subjected to systematic analysis and may result in corrective actions or continuous improvement.

Conformity to standards

All Schneider Electric brand inductive proximity sensors conform to and are tested in accordance with the recommendations of IEC standard 60947-5-2.

Mechanical shock resistance

The sensors are tested in accordance with standard IEC 60068-2-27, 50 gn, duration 11 ms.

Vibration resistance

The sensors are tested in accordance with standard IEC 60068-2-6, amplitude ± 2 mm, 10–55 Hz, 25 gn at 55 Hz.

Resistance to the environment

- Refer to the specifications pages for the various sensors.
- **IP 67**: protection against the effects of immersion.
  Test conforming to IEC 60529: sensor immersed for 30 minutes in 1 m (39.37 in.) of water.
  No deterioration in either operating or insulation specifications is permitted.
- **IP 68**: protection against prolonged immersion.
  Sensor immersed for 336 hours in 40 meters (131.23 ft) of water at 50 °C (122 °F) .
  No deterioration in either operating or insulation specifications is permitted.
  Schneider Electric sensors with an IP 68 degree of protection are ideal for use in the most arduous conditions, such as machine tools and automatic car washes.
- **IP 69K**: protection against the effects of high pressure cleaning. Adherence to DIN 40050 which stipulates that the product must withstand a water jet at a pressure of 90 bar (1305 psi) and temperature of +80 °C (176 °F) for 3 minutes.
  No deterioration in either operating or insulation specifications is permitted.

Resistance to electromagnetic interference

■ Electrostatic discharges	∼ and ≂ versions: level 4 immunity (15 kV). **IEC 61000-4-2**
■ Radiated electromagnetic fields (electromagnetic waves)	⎓, ∼ and ≂ versions: level 2 (3 V/m) or level 3 (10 V/m) immunity. **IEC 61000-4-3**
■ Fast transients (motor start/stop interference)	⎓ version: level 3 immunity (1 kV). ∼ and ≂ versions: level 4 immunity (2 kV) except Ø 8 mm model (level 2). **IEC 61000-4-4**
■ Impulse voltage	⎓, ∼ and ≂ versions: level 3 immunity (2.5 kV) except Ø 8 mm and smaller models (level 1 kV). **IEC 60947-5-2**

Resistance to chemicals in the environment

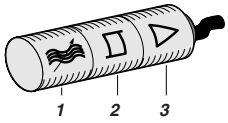
- Due to the very wide range of chemicals encountered in industry, it is very difficult to give general guidelines common to all sensors.
- End users should verify that the application does not subject sensors to chemicals that may damage them.
- Cylindrical and flat plastic-case sensors offer excellent overall resistance to:
  - chemical products such as salts, aliphatic and aromatic oils, petroleum, acids and diluted bases. For alcohols, ketones and phenols, preliminary tests should be made relating to the nature and concentration of the liquid.
  - food and beverage industry products such as animal or vegetable based products (vegetable oils, animal fat, fruit juice, dairy proteins, etc.).

The materials selected (see product specifications) provide satisfactory compatibility in most industrial environments (for further information, consult our Customer Information Center).

Class 2 devices ⧈

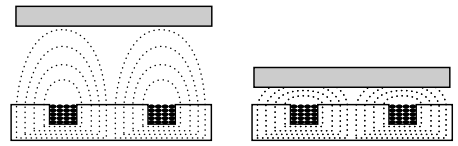
OsiSense® XS
Inductive proximity sensors

Principle of inductive detection



1 Oscillator
2 Output driver
3 Output stage

Composition of an inductive proximity sensor



Detection of a metal object

Operating principle

■ An inductive proximity sensor is solely for the detection of metal objects.
It essentially comprises an oscillator whose windings constitute the sensing face. An alternating magnetic field is generated in front of these windings.

■ When a metal object is placed within the sensor's magnetic field, currents are induced. These currents form an additional load, causing the sensor's oscillations to cease. This cessation causes the output driver to operate: depending on the sensor type, a normally open (NO) or normally closed (NC) output signal is produced.

2

Inductive proximity detection

■ Inductive proximity sensors enable the detection, without physical contact, of metal objects.
■ Their range of applications is very extensive and includes:
□ monitoring the position of machine parts (cams, end stops, etc.),
□ counting the number of metal objects, etc.

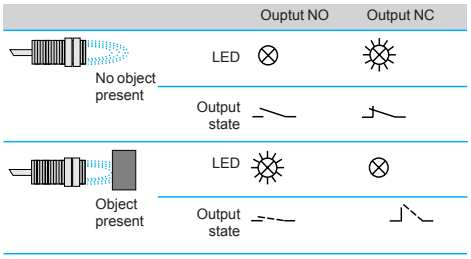
Advantages of inductive detection

■ No physical contact with the object to be detected, thus avoiding wear and enabling detection of fragile objects, freshly painted objects, etc.
■ High operating rates. Fast response.
■ Excellent resistance to industrial environments (robust products, fully encapsulated in resin).
■ Solid-state technology: no moving parts, therefore service life of sensor not related to number of operating cycles.

Flush mountable using teach mode sensors

■ The flush mountable sensors using teach mode are suitable for all metal environments (flush mountable or non-flush mountable) since they ensure a maximum sensing distance, even if there is a metal background. Precise detection of the position of the object can be obtained using the teach mode. For further information, see page 2/70.

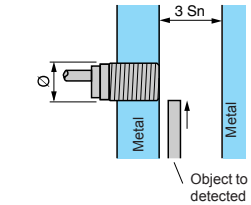
LED indicator

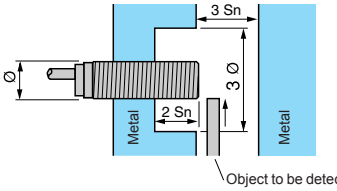


Output LED

All Schneider Electric inductive proximity sensors incorporate an output state LED indicator. The flush mountable sensors using teach mode are fitted with a green LED that indicates "Power on" and also assists the user during setup (teach mode).

Mounting sensors on a metal support





Flush mountable in metal

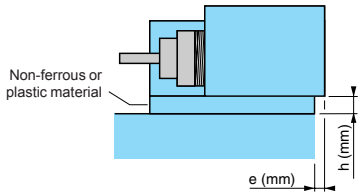
■ No side clearance required.
■ All flush mountable sensors using teach mode also enable detection of an object against a metal background. For further information, see page 2/70.

Sensors not suitable for flush mounting in metal

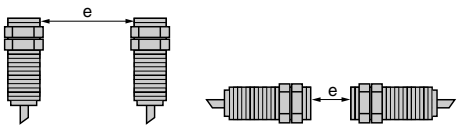
■ Side clearance required.
Sensing distance greater than that for a standard flush mountable model.
■ Flush mountable sensors using teach mode eliminate the need for side clearance. For further information, see page 2/70.

OsiSense® XS
Inductive proximity sensors

Mounting sensors on a metal support



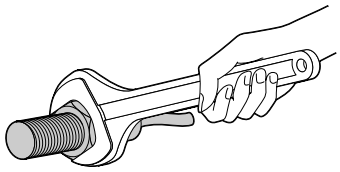
Mounting distance between sensors



Mounting side by side
e≥ 2 Sn (mm)

Mounting face to face
e ≥ 10 Sn (mm)

Tightening torque for cylindrical type sensors



Mounting using mounting clamp

- ■ Standard flush mountable models: e = 0, h = 0
- ■ Standard non-flush mountable models
- □ Ø 6.5 / 8 / 12 mm: e = 0, h = 0
- □ Ø 18 mm: if h = 0, e ⩾ 5; e = 0, h ⩾ 3.
- □ Ø 30 mm: if h = 0, e ⩾ 8; e = 0, h ⩾ 4.
- ■ Flush mountable sensors using teach mode: e = 0, h = 0

Standard sensors

If two standard sensors are mounted too close to each other they are likely to lock in the "detection state" due to interference between their respective oscillating frequencies.
To avoid this condition, the minimum mounting distances stated for the sensors should be adhered to or, alternatively, sensors with staggered oscillating frequencies should be used.

Staggered frequency sensors

For applications where the minimum recommended mounting distances for standard sensors cannot be achieved, it is possible to overcome this restraint by using staggered frequency sensors. consult the Sensor Competency Center.
In this case, a staggered frequency sensor is mounted adjacent to or opposite each standard sensor.

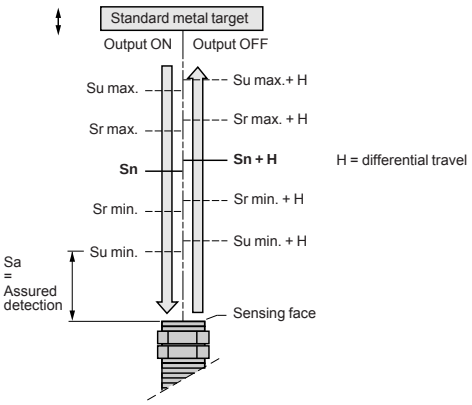
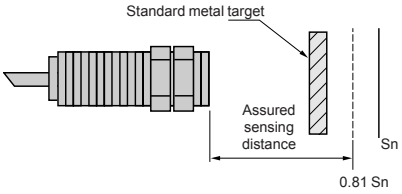
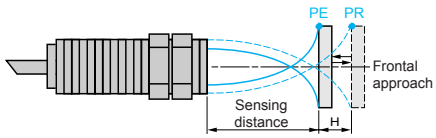
OsiSense® XS
Inductive proximity sensors

Sensing distance

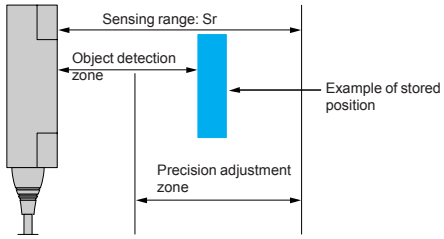


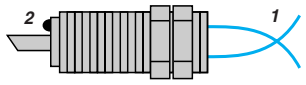


Terminology



PE = pick-up point, the object is detected
PR = drop-out point, the object is no longer detected





1 *Detection threshold curves*
2 *"Object detected" LED*

Definitions

In order to allow customers to make reliable product comparisons and selection, the standard IEC 60947-5-2 defines various sensing distances, such as:

- **Nominal sensing distance (Sn)**
  The rated operating distance for which the sensor is designed. It does not take into account any variations (manufacturing tolerances, temperature, voltage).
- **Effective sensing distance (Sr)**
  The effective sensing distance is measured at the rated voltage (Un) and the rated ambient temperature (Tn).
  It must be between 90% and 110% of the nominal sensing distance (Sn):
  $0.9\ Sn \leq Sr \leq 1.1\ Sn$.
- **Usable sensing distance (Su)**
  The usable sensing distance is measured at the limits of the permissible variations in the ambient temperature (Ta) and the supply voltage (Ub). It must be between 90% and 110% of the effective sensing distance: $0.9\ Sr \leq Su \leq 1.1\ Sr$.
- **Assured operating distance (Sa).**
  This is the operating zone of the sensor. The assured sensing distance is between 0 and 81% of the nominal sensing distance (Sn): $0 \leq Sa \leq 0.9 \times 0.9 \times Sn$

Standard metal target

The standard IEC 60947-5-2 defines the standard metal target as a square mild steel (Fe 360) plate, 1 mm (0.04 in.) thick.
The side dimension of the plate is either equal to the diameter of the circle engraved on the sensing face of the sensor or three times the nominal sensing distance (Sn).

Differential travel

The differential travel (H), or hysteresis, is the distance between the operating point, as the standard metal target moves towards the sensor, and the release point, as it moves away. This hysteresis is essential for the stable operation of the sensor.

Repeat accuracy

The repeat accuracy (R) is the repeatability of the sensing distance between successive operations. Readings are taken over a period of time while the sensor is subjected to voltage and temperature variations: 8 hours, 10 to 30 °C (50 to 86 °F), Un ± 5%.
It is expressed as a percentage of the effective sensing distance Sr.

Detection zone and precision adjustment zone

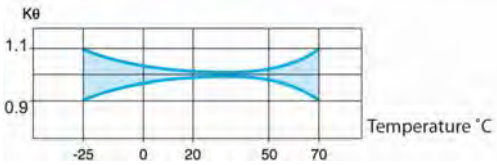
- Flush mountable sensors using teach mode, due to adjustment of sensitivity while teaching, enable the position of an object to be detected as it approaches from the front or side.
  The teach mode can be used when the object is located in the zone known as the "precision adjustment zone". When the object approaches from the front, the detection zone of the object ranges from the stored position down to zero.

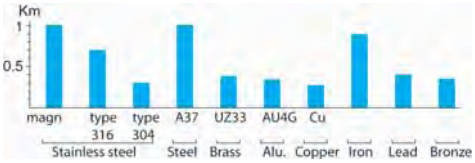
Operating zone

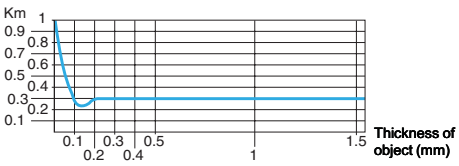
- The operating zone relates to the area in front of the sensing face in which the detection of a metal object is certain.
  The values stated in the specifications relating to the various types of sensor are for steel objects of a size equal to the sensing face of the sensor.
  For objects of a different nature (smaller than the sensing face of the sensor, other metals, etc.), it is necessary to apply a correction coefficient.

OsiSense® XS
Inductive proximity sensors

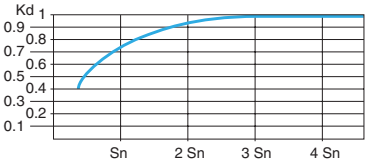
Correction coefficients to apply to the assured operating distance







*Typical curve for a **copper** object used with a Ø 18 mm cylindrical sensor*



*Typical curve for a **steel** object used with a Ø 18 mm cylindrical sensor*

Assured operating distance of a sensor

In practice, most objects to be detected are generally made of steel and are of a size equal to or greater than the sensing face of the sensor.

For the calculation of the assured operating distance for different operating conditions, you must take into account the correction coefficients that influence it.

The curves indicated are purely representational of typical curves. They are only given as a guide to the approximate usable sensing distance of a proximity sensor for a given application.

Influence of ambient temperature

Apply a correction coefficient Kθ, determined from the curve shown opposite.

Material of object to be detected

Apply a correction coefficient Km, determined from the diagram shown opposite.

The fixed sensing distance models for ferrous/non-ferrous (Fe/NFe) materials enable the detection of different objects at a fixed distance, regardless of the type of material.

Special case of a very thin object made of a non-ferrous material.

Size of object to be detected

Apply a correction coefficient Kd, determined from the curve shown opposite.
When calculating the sensing distance for the selection of a sensor, make the assumption that Kd = 1.

Variation of supply voltage

In all cases, apply the correction coefficient Kt = 0.9.

Calculation examples

Correction of the sensing distance of a sensor

Sensor with nominal sensing distance Sn = 15 mm.
Ambient temperature variation 0 to + 20 °C.
Object material and size: steel, 30 x 30 x 1 mm thick.
The assured sensing distance Sa is determined using the formula:
Sa = Sn x Kq x Km x Kd x Kt = 15 x 0.98 x 1 x 0.95 x 0.9
i.e. Sa = 12.5 mm.

Selecting a sensor for a given application

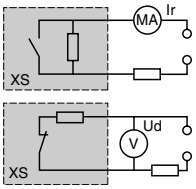
Application specifications:
- object material and size: iron (Km = 0.9), 30 x 30 mm,
- temperature: 0 to 20 °C (Kθ = 0.98),
- object detection distance: 3 mm ± 1.5 mm, i.e. Sa max. = 4.5 mm,
- assume Kd = 1.

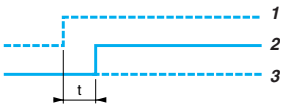
A sensor must be selected for which $\mathbf{Sn \geq \frac{Sa}{Kq \times Km \times Kd \times Kt} = \frac{4.5}{0.98 \times 0.9 \times 1 \times 0.9}}$

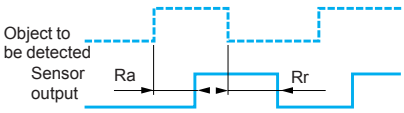
i.e. **Sn ≥ 5.7 mm**

OsiSense® XS
Inductive proximity sensors

Specific aspects of electronic sensors







Terminology

- ■ Residual current (Ir)
- □ The residual current (Ir) corresponds to the current flowing through the sensor when in the "open" state.
- □ Characteristic of 2-wire type proximity sensors.

- ■ Voltage drop (Ud)
- □ The voltage drop (Ud) corresponds to the voltage drop at the sensor's terminals when in the "closed" state (value measured at nominal current rating of sensor).

- ■ First-up delay
- □ The first-up delay corresponds to the time (t) between the connection of the power supply to the sensor and its fully operational state.

1 *Supply voltage U on*
2 *Sensor operational at state 1*
3 *Sensor at state 0*

- ■ Response time
- □ Response time (Ra): the time delay between the object to be detected entering the sensor's operating zone and the subsequent change of output state. This parameter limits the speed and size of the object.
- □ Recovery time (Rr): the time delay between an object to be detected leaving the sensor's operating zone and the subsequent change of output state. This parameter limits the interval between successive objects.

2

Supply

Sensors for AC circuits (∿ and ≂ models)

Check that the voltage limits of the sensor are compatible with the nominal voltage of the AC supply used.

Sensors for DC circuits

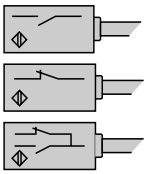
- ■ **DC source:** check that the voltage limits of the sensor and the acceptable level of ripple are compatible with the supply used.

- ■ **AC source** (comprising transformer, rectifier, smoothing capacitor): the supply voltage must be within the operating limits specified for the sensor.

Where the voltage is derived from a single-phase AC supply, the voltage must be rectified and smoothed to ensure that:
- the peak voltage of the DC supply is lower than the maximum voltage rating of the sensor.
Peak voltage = nominal voltage x $\sqrt{2}$
- the minimum voltage of the supply is greater than the minimum voltage rating of the sensor, given that :
$\Delta V = (I \times t) / C$
ΔV = max. ripple: 10% (V),
I = anticipated load current (mA),
t = period of 1 cycle (10 ms full-wave rectified for a 50 Hz supply frequency),
C = capacitance (µF).
As a general rule, use a transformer with a lower secondary voltage (Ue) than the required DC voltage (U).

Example:
∿ 18 V to obtain ⎓ 24 V,
∿ 36 V to obtain ⎓ 48 V.

Outputs



Output signal (contact logic)

- ■ Normally open (NO)

Corresponds to a sensor whose output changes to the closed state when an object is present in the operating zone.

- ■ Normally closed (NC)

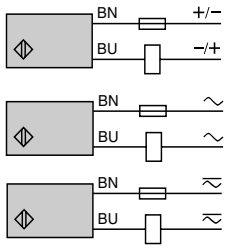
Corresponds to a sensor whose output changes to the open state when an object is present in the operating zone.

- ■ Complementary outputs (NO + NC)

Corresponds to a sensor with a normally closed output and a normally open output.

OsiSense® XS
Inductive proximity sensors

Outputs (continued)



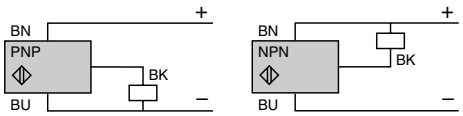
2-wire ⎓ type, non-polarized NO or NC output

■ **Specific aspects**

These sensors are wired in series with the load to be switched.
As a consequence, they are subject to:
- a residual current in the open state (current flowing through the sensor in the “open” state)
- A voltage drop in the closed state (voltage drop across the sensor’s terminals in the “closed” state)

■ **Advantages**
- Only two leads to be wired: these sensors can be wired in series in the same way as mechanical limit switches
- They can be connected to either positive-logic (PNP) or negative-logic (NPN) PLC inputs
- Simple, reversible connections

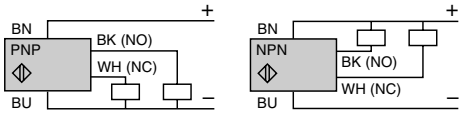
■ **Operating precautions**
- Check the possible effects of residual current and voltage drop on the actuator or input connected,
- For sensors that do not have overload and short-circuit protection (AC or AC/DC symbol), a 0.4 A fast-acting fuse must be connected in series with the load.



3-wire ⎓ type, NO or NC output, PNP or NPN

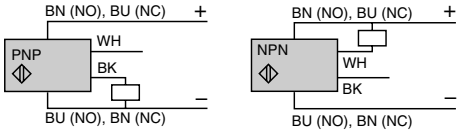
■ **Specific aspects**
- These sensors comprise two wires for the DC supply and a third wire for the output signal,
- PNP type: switching the positive side to the load
- NPN type: switching the negative side to the load

■ **Advantages**
- Protection against supply reverse polarity
- Protection against overload and short-circuit
- No residual current, low voltage drop



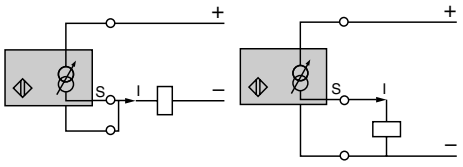
4-wire ⎓ type, complementary NO and NC outputs, PNP or NPN

■ **Advantages**
- Protection against supply reverse polarity (+/-)
- Protection against overload and short-circuit



4-wire ⎓ type, multifunction, programmable NO or NC output, PNP or NPN

■ **Advantages**
- Protection against supply reverse polarity (+/-)
- Protection against overload and short-circuit



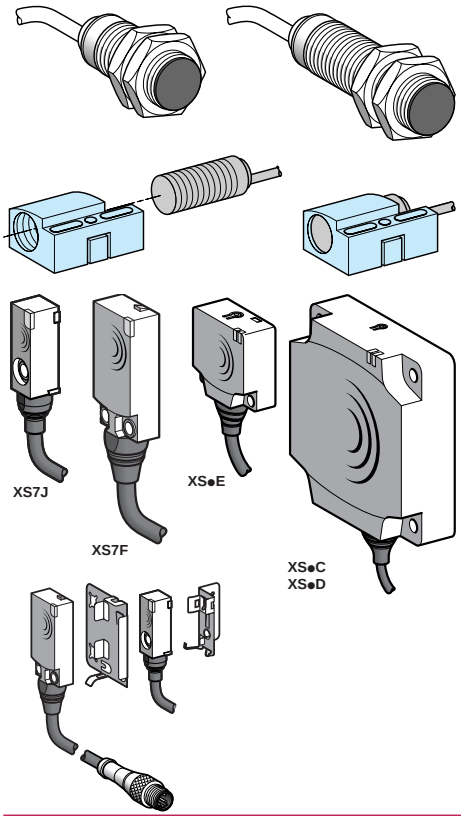
2-wire connection *3-wire connection*

Specific output signals, analog type

■ These sensors convert the approach of a metal object towards the sensing face into an output current variation which is proportional to the distance between the object and the sensing face.
■ Two models available:
- 0–10 V (0–10 mA) output for 3-wire connection
- 4–20 mA output for 2-wire connection

OsiSense® XS
Inductive proximity sensors

Features of the various models

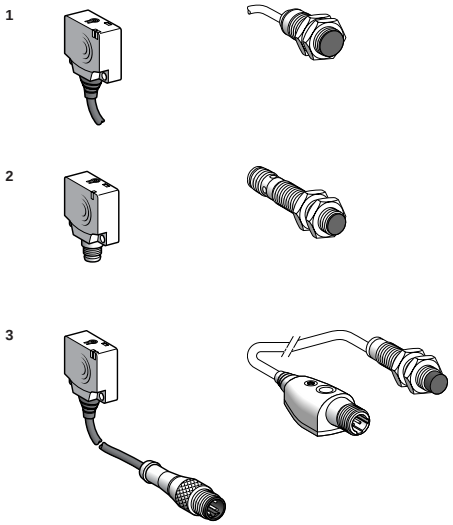


Types of case

■ **Cylindrical case**
□ Fast installation and setup.
□ Short case and long case, 2-wire ⎓ and 3-wire ⎓ versions available.
□ Pre-cabled (molded cable) and various integral connector (M8, M12, 7/8", M18) and remote connector (on pigtail connector) versions available.
□ Small size facilitates mounting in locations with restricted access.
□ **Interchangeability**, provided by indexed **mounting clamp**: when assembled, becomes similar to a block type sensor.

■ **Flat case**
□ Reduced size (sensor volume divided by 8).
□ Fast installation by mounting using clip-on brackets.
□ Precision detection with the flush mountable sensors using teach mode
.

Electrical connection



Connection methods

1 Pre-cabled: factory-fitted molded cable, good protection against splashing liquids (IP 68). Example: machine tool.
2 Connector: easy installation and maintenance (IP 67).
3 Remote connector: easy installation and maintenance (IP 68 at sensor level and IP 67 at remote connector level).

Wiring

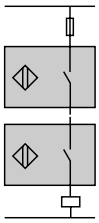
■ **Length of cable**
□ No limitation up to 200 m or up to a line capacitance of < 100 nF (specifications of sensor remain unaffected)
□ In this case, it is important to take into account the voltage drop on the line

■ **Separation of control and power circuit wiring**
□ The sensors are immune to electrical interference encountered in normal industrial conditions
□ Where extreme conditions of electrical “noise” could occur (large motors, spot welders, etc.) it is advisable to protect against transients in the normal way:
- suppress interference at source
- separate power and control wiring from each other
- smooth the supply
- limit the length of cable

■ **Connect the sensor with supply switched off.**

OsiSense® XS
Inductive proximity sensors

Setup



Connection in series

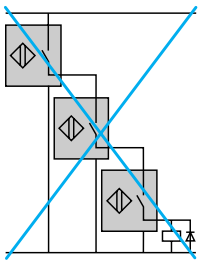
2-wire type sensors

- The following points should be taken into account:
- Series wiring is only possible using sensors with wide voltage limits.
  Based on the assumption that each sensor has the same residual current value, each sensor, in the open state, will share the supply voltage, i.e.

$$U\ sensor = \frac{U\ (supply)}{n\ sensors}$$

U sensor and U supply must remain within the sensor's voltage limits.

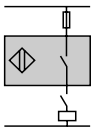
- If only one sensor in the circuit is in the open state, it will be supplied at a voltage almost equal to the supply voltage.
- When in the closed state, a small voltage drop is present across each sensor. The resulting loss of voltage at the load will be the sum of the individual voltage drops and therefore, the load voltage should be selected accordingly.



3-wire type sensors

This connection method is not recommended.

- Correct operation of the sensors cannot be assured and, if this method is used, tests should be made before installation.
  The following points should be taken into account:
- Sensor 1 carries the load current in addition to the no-load current consumption values of the other sensors connected in series. For certain models, this connection method is not possible unless a current limiting resistor is used.
- When in the closed state, a small voltage drop is present across each sensor. The load should therefore be selected accordingly.
- As sensor 1 closes, sensor 2 does not operate until a certain time (t) has elapsed (corresponding to the first-up delay) and likewise for the following sensors in the sequence.
- The use of "flywheel" diodes is recommended when an inductive load is being switched.



Sensors and devices in series with an external mechanical contact

2 and 3-wire type sensors

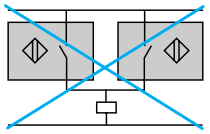
- The following points should be taken into account:
- When the mechanical contact is open, the sensor is not supplied.
- When the contact closes, the sensor does not operate until a certain time (t) has elapsed (corresponding to the first-up delay).

Connection in parallel

2-wire type sensors

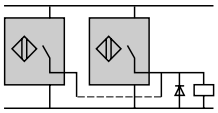
This connection method is not recommended.

- Should one of the sensors be in the closed state, the sensor in parallel will be "shorted-out" and no longer supplied.
  As the first sensor passes into the open state, the second sensor will become energized and will be subject to its first-up delay.
- This configuration is only permissible where the sensors will be working alternately.
- This method of connection can lead to irreversible damage to the units.



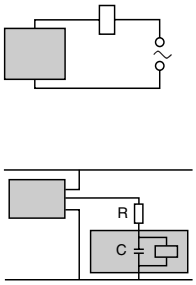
3-wire type sensors

- No specific restrictions. The use of "flywheel" diodes is recommended when an inductive load (relay) is being switched.



AC supply

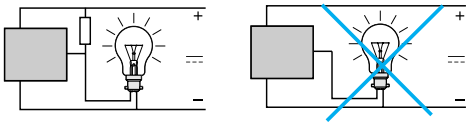
- **2-wire type sensors cannot be connected directly to an AC supply.**
- Improper installation can result in injury or sensor damage
- An appropriate load (refer to the instruction sheet supplied with the sensor) must always be connected in series with the sensor.



Capacitive load (C > 0.1 µF)

- On power-up, it is necessary to limit (by resistor) the charging current of the capacitive load C.
- The voltage drop in the sensor can also be taken into account by subtracting it from the supply voltage for the calculation of R.

$$R = \frac{U\ supply}{I\ max.\ (sensor)}$$



Load comprising an incandescent lamp

- If the load comprises an incandescent lamp, the hot state resistance can be 10 times higher than the cold state resistance. This can cause very high current levels on switching. Fit a pre-heat resistor in parallel with the sensor.

$$R = \frac{U^2}{P} \times 10$$, U = supply voltage and P = lamp power

OsiSense® XS
Inductive proximity sensors

Fast troubleshooting guide

Problem	Possible causes	Remedy
The sensor's output will not change state when a metal object enters the detection zone	On a flush mountable sensor using teach mode: setup or programming error.	■ After a RESET, follow the environment teach mode procedure. Refer to instruction sheet supplied with sensor.
	Inoperative sensor or the short circuit protection has been opened	■ Check that the sensor is compatible with the supply being used. ■ Check the load current specifications: □ if load current I ≥ maximum switching capacity, an auxiliary relay, of the CADN type for example, should be interposed between the sensor and the load, □ if I ≤ maximum switching capacity, check for wiring issues (short-circuit). ■ In all cases, a 0.4 A fast-acting fuse should be connected in series with the sensor.
	Wiring error	■ Check that the wiring conforms to the wiring shown on the sensor label or instruction sheet.
	Improper power supply	■ Check that the sensor is compatible with the supply (∼ or ⎓). ■ Check that the supply voltage is within the voltage limits of the sensor. Remember that with a rectified, smoothed supply, U peak = U nominal x $\sqrt{2}$ with a ripple voltage ≤ 10%.
False or erratic operation, with or without the presence of a metal object in the detection zone	On flush mountable sensor using teach mode: setup or programming error.	■ After a RESET, follow the environment teach mode procedure. Refer to instruction sheet supplied with sensor.
	Influence of background or metal environment	■ Refer to the instruction sheet supplied with the sensor. For sensors with adjustable sensitivity, reduce the sensing distance.
	Sensing distance poorly defined for the object to be detected	■ Apply the correction coefficients. ■ Realign the system or run the teach mode again.
	Influence of transient interference on the supply lines	■ Ensure that any DC supplies, when derived from rectified AC, are correctly smoothed (C > 400 µF). ■ Separate AC power cables from low-level DC cables (24 V low level). ■ Where very long distances are involved, use suitable cable: screened and twisted pairs of the correct cross-sectional area.
	Equipment prone to emitting electromagnetic interference	■ Position the sensors as far away as possible from any sources of interference.
	Response time of the sensor too slow for the particular object being detected	■ Check the suitability of the sensor for the position or size of the object to be detected. ■ If necessary, select a sensor with a higher switching frequency.
	Influence of high temperature	■ Eliminate sources of radiated heat or protect the sensor casing with a heat shield. ■ Realign, having adjusted the temperature around the mounting support.
No detection following a period of service	Vibration, shock	■ Realign the system. ■ Replace the support or protect the sensor.

Specifications

Sensor type			XS1●●B3●●M8	XS1●●B3●●M12	XS1●●B3●●L2
Product certifications			UL, CSA, CE		
Connection	Connector		M8	M12	–
	Pre-cabled		–	–	Length 2 m
Operating zone	Ø 6.5 and Ø 8	mm	0–1.6 (0–0.06 in.)		
	Ø 12	mm	0–3.2 (0–0.12 in.)		
	Ø 18	mm	0–6.4 (0–0.25 in.)		
	Ø 30	mm	0–12 (0–0.47 in.)		
Differential travel		%	1–15 of effective sensing distance (Sr)		
Degree of protection	Conforming to IEC 60529		IP 65 and IP 67		
Storage temperature		°C	-40 to +85 (-40 to +185 °F)		
Operating temperature		°C	-25 to +70 (-13 to +158 °F)		
Materials	Case		Nickel-plated brass		
	Cable		–		PvR 3 x 0.34 mm² (22 AWG) except Ø 6.5 and 8: 3 x 0.11 mm² (27 AWG)
Vibration resistance	Conforming to IEC 60068-2-6		25 gn, amplitude ± 2 mm (f = 10 to 55 Hz)		
Shock resistance	Conforming to IEC 60068-2-27		50 gn, duration 11 ms		
Output state indication			Yellow LED, 4 viewing ports at 90°		Yellow LED, annular
Rated supply voltage		V	⎓ 12–24 with protection against reverse polarity		
Voltage limits (including ripple)		V	⎓ 10–36		
Switching capacity		mA	≤ 200 with overload and short-circuit protection		
Voltage drop, closed state		V	≤ 2		
Current consumption, no-load		mA	≤ 10		
Maximum switching frequency	Ø 6.5, Ø 8, and Ø 12	Hz	2500		
	Ø 18	Hz	1000		
	Ø 30	Hz	500		
Delays	First-up	ms	≤ 10		
	Response	ms	≤ 0.2 for Ø 8 and Ø 12, ≤ 0.3 for Ø 18, ≤ 0.6 for Ø 30		
	Recovery	ms	≤ 0.2 for Ø 8 and Ø 12, ≤ 0.7 for Ø 18, ≤ 1.4 for Ø 30

(1) For a 5 m cable replace L2 with L5.
*Example: XS208ALPAL2 becomes **XS208ALPAL5** with a 5 m cable.*
(2) For a 5 m cable replace L2 with L5; for a 10 m cable replace L2 by L10.
*Example: XS218ALPAL2 becomes **XS218ALPAL5** with a 5 m cable.*

OsiSense® XS
Inductive proximity sensors

(1) For a 5 m cable add L1 to the catalog number; for a 10 m cable add L2 .Example:
XS1L04PA310 *becomes* ***XS1L04PA310L1*** *with a 5 m cable.*

OsiSense® XS
Inductive proximity sensors
General purpose
Miniature, cylindrical, flush and non-flush mountable
Three-wire DC, solid-state output

Specifications

Sensor type			XS1●●●●●●●●S; XS1●●●●●●●●D; XS2L06●A340●	XS1●●●●●●●; XS2L06●A340
Product certifications			UL, CSA, CE	
Connection *(1)*	Connector		M8 on **XS1●●●●●●●●S** and M12 on **XS1●●●●●●●●D**	–
	Pre-cabled		–	Length: 2 m
Operating zone	Ø 4	**mm (in.)**	**0–0.8 (0–0.03) (brass) 0–0.6 (0–0.02) (stainless steel)**	
	Ø 5	**mm (in.)**	**0–0.8 (0–0.03) (brass), 0–0.6 (0–0.02) (stainless steel)**	
	Ø 6.5 non-flush mountable	**mm (in.)**	**0–2 (0.08) (stainless steel)**	
Degree of protection	Conforming to IEC 60529		IP 67	
Storage temperature		**°C (°F)**	-40 to +85 (-40 to +185)	
Operating temperature		**°C (°F)**	-25 to +70 (-13 to +158)	
Materials	Case		Nickel-plated brass or stainless steel, grade 303	
	Cable		PvR 3 x 0.11 mm² (26 AWG) or 4 x 0.08 mm² (20 AWG)	
Vibration resistance	Conforming to IEC 60068-2-6		25 gn, amplitude ± 2 mm (f = 10 to 55 Hz)	
Shock resistance	Conforming to IEC 60068-2-27		50 gn, duration 11 ms	
Output state indication			Yellow LED, 4 viewing ports at 90°	Yellow LED, annular
Rated supply voltage		**V**	⎓ 5–24 for **XS1L04●●●●●●** and **XS1N05●●●●●●** ⎓ 12–24 for **XS●L06●●●●●●**	
Voltage limits (including ripple)		**V**	⎓ 5–30 for **XS1L04●●●●●●** and **XS1N05●●●●●●** ⎓ 10–38 for **XS●L06●●●●●●**	
Current consumption, no-load		**mA**	≤ 10	
Switching capacity	3-wire PNP/NPN	**mA**	≤ 100 with overload and short-circuit protection ≤ 200 for **XS●L06** with overload and short-circuit protection	
Voltage drop, closed state		**V**	≤ 2	
Maximum switching frequency		**kHz**	5	
Delays	First-up	**ms**	≤ 5	
	Response	**ms**	≤ 0.1	
	Recovery	**ms**	≤ 0.1

OsiSense® XS
Inductive proximity sensors
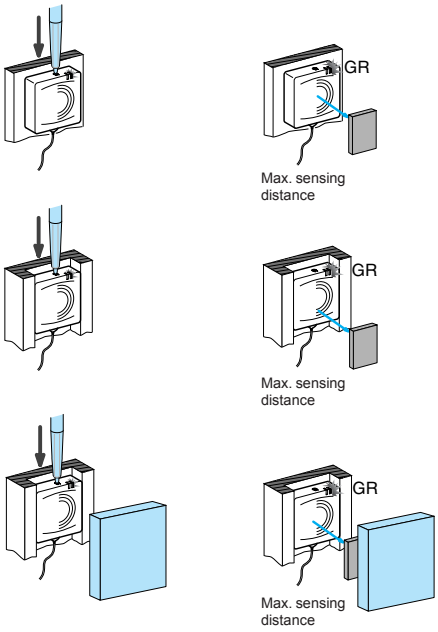
Flush mountable using teach mode



Operating principle

Schneider Electric's flush mountable sensors using teach mode offer simplicity through innovation.

■ A single product enables flush mounting using teach mode and meets all the requirements for inductive sensing of metal objects.
Simply press the "Teach mode" button, and the sensor automatically acquires optimum configuration for all sensing, flush mounting and environment requirements.

■ Other advantages of flush mountable sensors using teach mode
□ Increased performance:
- sensing distance optimized regardless of the mounting method, object, environment or background,
- suitable for all metal environments.

□ Simplified use provided by:
- the flush mountability using teach mode technology, associated with the availability of the flattest and most compact sensors on the market, simplifies integration in the machine and limits the risks of mechanical damage,
- mechanical adjustments no longer necessary due to teach mode.

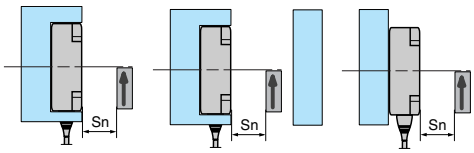
□ Lower costs due to:
- the elimination of adjustment times and complex supports
- the elimination of flush mountable and non-flush mountable versions, which decreases the number of catalog numbers,
- much easier and much quicker product selection.

Precision position detection

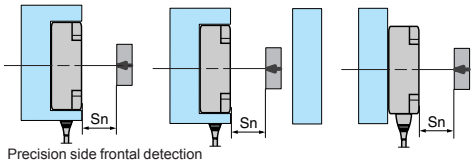
All flush mountable inductive proximity sensors using teach mode benefit from ultra-precise adjustment, which is very quick regardless of the metal environment.

■ Precision side approach detection makes it possible to accurately define the distance at which the object will be detected as it passes the sensor.
On flush mountable sensors using teach mode, the desired detection position can be stored in memory by simply pressing the teach button.

■ Precision frontal approach detection makes it possible to accurately define the distance at which the object will be detected as it approaches the sensor.
On flush mountable sensors using teach mode, the desired detection position can be stored in memory by simply pressing the teach button.



Precision side approach detection



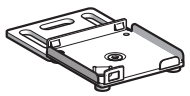
Precision side frontal detection

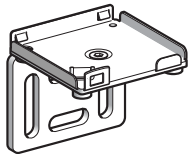
Mounting accessories

Schneider Electric offers a complete, inexpensive range of mounting accessories (clamps, plates, brackets, etc.) that provide solutions for all installation problems.

■ Mounting kits for quick installation or replacement of sensors

■ No adjustment is required. Simple clip-in enables the sensor to be mounted into position and ready for operation.





OsiSense® XS
Inductive proximity sensors
Application
Sensors for rotation monitoring, slip detection, shaft overload detection, Cylindrical form

Example:
Coupling breakage monitoring

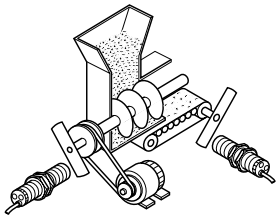

Figure 1

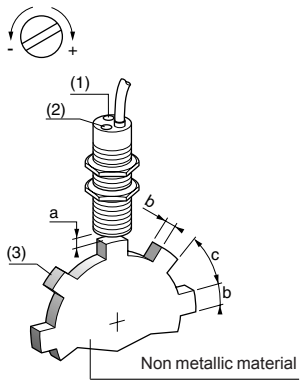

Functions
As a special feature, these self-contained rotation speed monitoring sensors incorporate, in the same case, the pulse sensing and processing electronics with the output switching amplifier, which are required to establish an integrated rotation monitoring device.

The unit provides an economical solution for detecting slip, belt breakage, drive shaft shear and overloading, etc., in the following applications: conveyor belts, bucket elevators, Archemedian screws, grinders, crushers, pumps, centrifugal driers, mixers, etc.

Operating principle
The output signal of this type of sensor is processed by an impulse comparator in the sensor. The impulse frequency Fc generated by the moving part to be monitored is compared to the frequency Fr preset on the sensor. The output switching circuit of the sensor is in the closed state for Fc > Fr and the open state for Fc < Fr.

Sensors XSA-V are particularly suitable for the detection of underspeed: when the speed of the moving part Fc falls below a preset threshold Fr, this causes the output circuit of the sensor to switch off.

Note: *Following power-up, the operational status of the sensor is subject to a delay of 9 seconds so the moving part being monitored and run up to its nominal speed. During this time, the output of the sensor remains in the closed state.*

Adjustment of frequency threshold

- Adjustment of sensor's frequency threshold: using potentiometer, 15 turns approximately.
- To increase the frequency threshold: turn the adjustment screw clockwise (+).
- To decrease the frequency threshold: turn the adjustment screw counter clockwise (–).

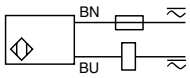
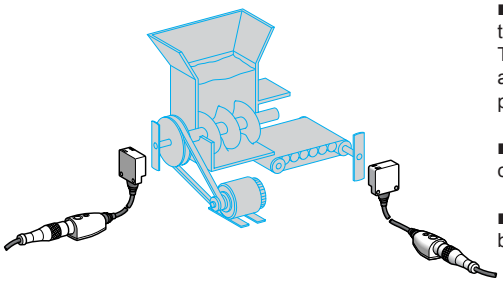
XSAV1●801



(1) For a 5 m cable add L05 to the catalog number, for a 10 m cable add L10.
*Example: XSA V11373 becomes **XSAV11373L05** with a 5 m cable.*
(2) These sensors do not incorporate overload or short-circuit protection and therefore, it is essential to connect a 0.4 A fast-acting fuse in series with the load, see page 2/131.
*(3) For a sensor without a run-up delay following power-up, replace XSA V1 in the catalog number by XSAV0. Example: XSA V11801 becomes **XSAV01801** without a run-up delay. For a reduced run-up delay of 3 s, replace XSAV1 in the catalog number with XSAV3.*

OsiSense® XS
Inductive proximity sensors
Application
Sensors for rotation monitoring, slip detection and shaft overload detection, with teach mode

Operating principle and applications

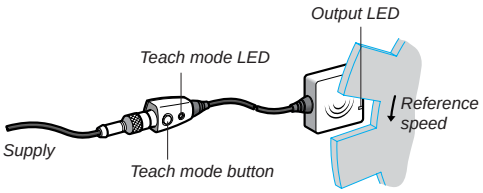


■ These inductive proximity sensors are designed for monitoring rotational speed or the speed of the flow of objects to be protected or monitored.
They operate on the principle of comparing a speed threshold preset by the operator against the instantaneous measurement of the speed of the moving object to be protected.

■ They provide a simple, economical solution for detecting slip, belt breakage, coupling breakage and overload, etc.

■ They are widely used in grinder/crusher, mixer, pump, centrifugal driver, conveyor belt, bucket elevator, Archimedean screw, etc. type applications.

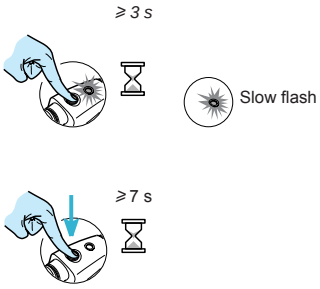
Installation and setup



Setup and positioning the sensor

■ In the positioning phase, the XS9 sensor can operate as a standard inductive sensor (Schneider Electric patent pending).
Operation in inductive mode enables validation of reliable detection of all the moving objects to be monitored.

■ Using this system, the positioning is reliable and can be checked at any time without altering the settings of the sensor.



Speed adjustment in teach mode

■ The normal or reference speed of the moving object (1) to be monitored is adjusted by simply pressing the teach mode button (*2*) and is then validated by the display LED.
□ If in doubt, the sensor can be reset at any time to the factory settings.
(1) To allow the moving object to reach its normal speed (machine inertia), the sensor holds its output closed for 9 seconds.
(2) The sensor's default drop-out underspeed corresponds to the preset speed - 30%.
Example: If the preset speed is 1000 rpm, the sensor drops out on underspeed when the speed of the moving object drops below 700 rpm [1000 – (1000 x 0.3)].
- 20%, - 11% and - 6% thresholds can be obtained by pressing the teach mode button.

OsiSense® XS
Inductive proximity sensors
Application
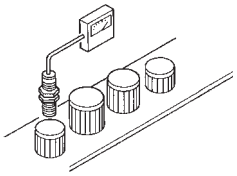
Sensors with analog output signal 0–10 V *(1)*
or 4–20 mA
For position, displacement and deformation control/monitoring

Functions

Example:
Sorting parts



These analog output proximity sensors are solid-state sensors designed for monitoring displacement. They are not measuring sensors. They are suitable for use in many sectors, particularly for applications involving:
- deformation and displacement monitoring,
- vibration amplitude and frequency monitoring,
- control of dimensional tolerances,
- position control,
- concentricity or eccentricity monitoring.

Operating principle

The operating principle of the sensor is that of a damped oscillator. The degree of damping will depend on the distance of an object from the sensing face. The sensor will sense the distance and produce an output current with a value directly proportional to this distance.

Operating curves 4–20 mA, 2-wire connection

Wiring diagrams

2-wire connection

	Output current	Load impedance value
12 V	4–20 mA	R ≤ 8.2 Ω
24 V	4–20 mA	R ≤ 470 Ω

Ensure a minimum of 10 V between the + and the - (terminal 3) of the sensor.

3-wire connection

	Output current	Load impedance value	Output voltage	Load impedance value
24 V	0–10 mA	R ≤ 1500 Ω	0–10 V	R = 1000 Ω
48 V	0–10 mA	R ≤ 3300 Ω	0–10 V	R = 1000 Ω

Ensure a minimum of 5 V between the + and the sensor output (terminal 4).

(1) Voltage range only obtained with a load impedance of 1000 Ω.

OsiSense® XS
Inductive proximity sensors
SG magnet actuated sensors
Surface mounted style

Surface-mounted, magnet-actuated sensors for industrial applications

- Sensing is independent of magnet polarity.
- Typical applications: security systems (gate interlocks), high-speed rotational counting, identification of metal bins with magnet-coded labels, sensing through non-magnetic walls.

Features

- Housing: aluminum except SG08168 and SG28195 are plastic (PBT)
- Completely encapsulated in epoxy
- Very fast response time (reed output only)
- PLC-compatible AC models (triac output)
- High transients protection (AC models)
- No bouncing

Tubular, magnet-actuated proximity sensors for heavy-duty applications such as:

- High-speed rotational counting
- Identification of metal bins with magnet-coded labels
- Sensing through non-magnetic walls

Sensing is independent of magnet polarity.

Features

- Housings: aluminum for SGA8057; plastic (PVC) for SGC8058, SGA8072, SGA8039; polymide for SGA8179, SGA8180, SGA8181
- Completely encapsulated in epoxy
- High transient protection
- Threaded and smooth housings
- High voltage versions
- SPST and SPDT models
- No bouncing
- UL recognized (except where noted with #).

SGO8141

in.
(mm)

Maintained contact model—A highly reliable, magnet-actuated proximity limit switch designed to maintain contact for high-speed stacker cranes, slow-down, and memory applications. Eliminates the camming required for mechanically operated limit switches. **Maintains the information even if power is down.**

Features

- Diecast zinc housing
- PLC compatibility
- High transient protection
- No bouncing
- 12.7 mm (0.5 in.) NPT conduit entrance
- UL recognized

When the north or south pole of a magnet actuator moves past the blue-dot sensitive area within the specified range along the switch, the contact position changes from open to closed. Once latched, the movement of the same magnetic pole in the opposite direction—or the movement of the opposite magnetic pole in the same direction—unlatches the switch.

NOTE: If during this procedure the switch closes and then opens again (pulses), reverse the polarity of the magnet and repeat the above procedure. If the desired direction of operation is opposite to that established above, reverse the polarity of the magnet.

Features

- Industrial grade magnet is recommended for magnet-actuated proximity sensors.
- Alnico is used as magnet material for all rigid models.
- Aramid fiber is used for the flexible magnetic tape.
- The rigid models come mounted on one of several types of standard brackets for convenience (except the tubular high-power version).
- Both south and north poles are accessible and marked. The south pole version is the standard. North pole versions may be required in conjunction with the maintained magnetic switch.
- For comparison, an average magnetic strength rating is listed below. Measurements were made with a Gaussmeter at 3.3 mm (0.13 in.) from the sensing surface.

Description		Magnetic Strength	Catalog Number
Tubular		700 Gauss	**7046**

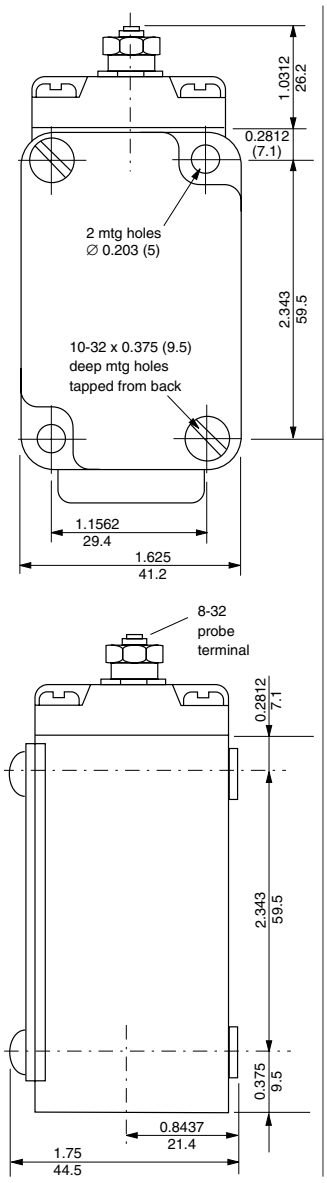
ST grounded probe switch

Dimensions



in.
(mm)

The touch switch is a highly reliable AC solid-state presence sensor designed for precise conductivity sensing. Applications include high temperature, light conductive, aggressive mechanical, and chemical environments that target positive end-point sensing. All models have a visible neon pilot light to indicate operation of the switch.

Features

- Diecast zinc housing
- Solid state—no moving parts
- 115 Vac, completely self-contained
- Probes up to 10 ft (3 m) long
- High current output—no relay required for most applications
- Fast response—no warm-up time
- 12.7 mm (0.5 in.) NPT conduit entrance
- UL Recognized

Operation

The switch is actuated when a conductive path is established between the probe terminal and ground (1 M Ω or less). The electrical contact to ground operates the switching thyristor. Internal RC snubber and varistor provide effective protection from typical transients. Normal open models have a 10 ms (maximum) turn on time. Different off-delay times are offered to permit compensation for relay chatter when the probe is subjected to bounce from irregular contact with the grounded metal point of contact.

NOTE: For isolated circuits where the ground is not common, the ground terminal of the switch should be connected to the neutral. The metal target to be detected by the probe should also then be wired to the neutral.

Probe characteristics

The probe terminal is an 8-32 stud protruding from the center of the head.
Extensions may be any electrically conductive wire or material suitably insulated from grounded surface and limited in length to 3 m (10 ft) or less.

- Open voltage: 12 Vdc
- Peak current: 1 mA

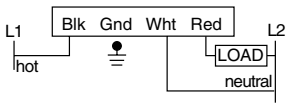
OsiSense® XS
Inductive proximity sensors
ST grounded probe switch

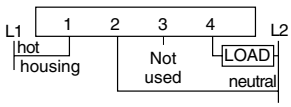
Wiring

Cable wiring



Target connected to ground

Terminal strip wiring



Target connected to ground. Housing must be grounded for proper operation.

Model ST switches may be wired in series or parallel. Connect the red lead to the black lead of other switch (terminal 4 to terminal 1 of the other switch) for series operation. The voltage drop across each switch (in the closed state) does not exceed 2 Vac.

Face caps for tubular proximity sensors

Features

- Shielded and non-shielded caps available
- Different versions available (beveled or non-beveled)
- Helps to provide sensor face protection with no effect on operation

Description

Protection in harsh applications, helps to prevent abrasions, cracks, and other possible damage to the sensor face. Available in several different materials: Ceramic, acetal resin, and Fluorinated hydrocarbon coated material. Helps provide the sensor with protection and a longer life without the additional charge of a stainless steel face option.

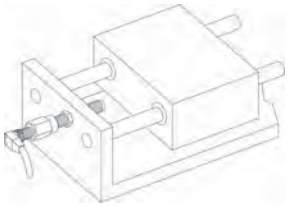
OsiSense® XS
Inductive proximity sensors
Plunger screw adapters



Features

- Accepts 8, 12, or 18 mm shielded sensor
- Heat-treated alloy steel construction
- Rugged stop with solid-state output

Description

Plunger screw adapters allow a shielded inductive proximity sensor to be used as a mechanical stop switch in applications requiring a precise end-of-travel signal or a hard stop. The spring requires a force of 252 g (9 oz) to actuate the sensor.

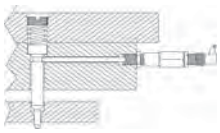
OsiSense® XS
Inductive proximity sensors
Proximity probe adapters, conduit adapters for tubular sensors



Features

- Accepts any 8 or 12 mm shielded sensor
- Accurate and compact switching in confined areas
- Large variety of stand probe lengths and diameters

Description

Proximity probes are spring-loaded actuators designed to work with 8 mm or 12 mm tubular inductive proximity sensors. The probe and sensor combination offers increased flexibility in applications that require tight positioning.

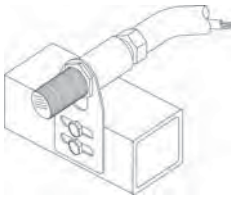
XSZPP●●●●

Conduit Adapters for Tubular Sensors



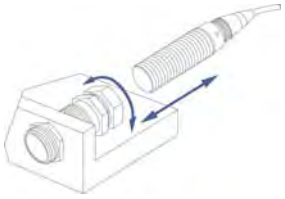
XSZCAR●●

Features

- Available for 12, 18, and 30 mm tubular sensors
- 1/2 in. NPT inside thread
- Nickel-plated brass

Tube Diameter	Tube Thread Size	Dimensions, mm (in.)	Catalog Number
12 mm (0.47 in.)	M12 x 1		**XSZCAR12**
18 mm (0.71 in.)	M18 x 1		**XSZCAR18**
30 mm (1.18)	M30 x 1.5		**XSZCAR30**

OsiSense® XS
Inductive proximity sensors
Quick change mounting tube



Features

- Quick change mounting available for 8, 12, 18, and 30 mm sensors
- Short and long barrel lengths available
- One-time adjustment simplifies sensor replacement
- Helps protect the sensor from impact and damage
- Fluorinated hydrocarbon coated caps available for quick change mounts (shown below)

Description

The quick change mounting tube reduces sensor maintenance and helps prevent downtime. An internal shoulder stop and collet-style locknut precisely hold the sensor in place—helping maintain a precise sensing distance and simplifying sensor installation.

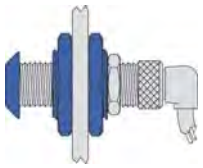
OsiSense® XS
Inductive proximity sensors
Spring-loaded tubular sensor mount



Features

- Accepts 8, 12, 18, and 30 mm shielded or non-shielded sensors
- Shocked is absorbed so sensors can possibly be unaffected by accidental impact
- Shielded and non-shielded caps available (see page 2/126)

Description

Spring-loaded sensor mount for tubular body styles helps prevent impact damage to the sensor from target overtravel. The mount is designed to be threaded onto a tubular sensor and held in place with one of the mounting nuts provided with the sensor. Caps are available to help protect the face of the sensor from lateral and axial impacts (see page 2/126).

(1) For the new sensor an integral M12 connector replaces the remote M12 connector on a 0.80 m pigtail connector.
(3) For the new OsiSense XS sensor, the metal case replaces the plastic case.
(4) For the new sensor, connectors A, B, C and G on 0.1 m pigtail connector replace integral connectors A, B, C and G.
(5) For the new sensor, Sn = 15 mm (0.59 in.) instead of 20 mm (0.79 in.)
